CH

2 May

On the basis of accessible indigenous raw materials (ferrosilicon, CH_3Cl), a method was worked out of direct synthesis of methyl chlorosilanes. It was found that: — 1) the quality of the silicon influences the course of synthesis and the results; 2) the best catalyst is about 10 per cent. of freshly reduced copper; 3) zinc influences the composition of the compounds increasing the M.T.S. content and reducing that of D.D.S. (M.T.S.=methyltrichlorosilane, D.D.S.=dimethyldichlorosilane); 4) the flow of methyl chloride obtained, amounts, according to present results, to 10 g. per hour for 100 g. Si; 5) with a sufficiently active contact mixture the synthesis can be effected at 280 to 300°C; 6) it is advisable to use hydrogen during the activation, since it lowers the temperature of the reaction, reduces the consumption of methylchloride, shortens the time of the experiment and shifts the compound towards the difunctional monomer — D.D.S.; 7) for liquefaction of the products, cooling of the post-reaction gases to a temperature below -15°C is essential; 8) the yield of crude mixture varies between 2.5 and 3 g. per 1 g.Si, the content of D.D.S. is between 15 and 30 per cent. or higher, and that of M.T.S. — between 40 and 60 percent.; 9) the degree of transformation of silicon attains 83 per cent. that of methyl chloride — 93 per cent.

Leipzig, Archiv fuer Experimentelle Veterinaermedizin, Vol 20, No 5, Nov 1966, pp 901-903.

Abstract: Cattle inhabiting areas supplied with urban effluent waters have a higher infection incidence from atypical mycobacteria than do cattle from areas not so supplied. The former show higher titers in the hemagglutination reaction in the autumn and the winter than in other seasons. The results of a series of allergic and serological tests were presented and discussed. (10 references, including 4 German, 1 Russian, 3 Polish, and 2 Western. (Manuscript received 25 Nov 1965).

Industrial application of silica of organic origin. Wacław Sobierajski. *Chemik* 10, 284-7(1957).—S. discusses diatomaceous earth and siliceous earth derived from sponges (I). Poland has only deposits of I. The best deposits are in Piotrowice near Zawichost. They are 2-5 m. below the surface and are calcd. to contain 2-3 million tons. Their compn. is: SiO₂ 90.10, Fe₂O₃ 2.31, Al₂O₃ 4.02, CaO 0.94, MgO 0.24, loss on calcining 2.07%, and SO₃ in traces. The application of I from Piotrowice is in the paper and rubber industries (as a white filler), for impregnation with catalysts (supports) for the Fischer-Tropsch synthesis, for insulation mixts., for prepns. of acid-resistant cements, water glass, for the prepns. of a mixt. for cleaning crude C₆H₆, for attrition mixts., for packaging bottles with acidic or caustic liquids, and for the prepns. of blotting paper. TITLE: Technical Progress in the Polish Chemical Industry in the Light of
Its Cooperation with the USSR

PERIODICAL: Przemysł Chemiczny, 1960, Vol. 39, No. 9, pp. 535 - 536

TEXT: The author stresses the importance of the Soviet help and cooperation in the expansion of the chemical industry in Poland. Among others, the following installations have been built or expanded with Soviet assistance: Fabryka Karbidu (Carbide Plant), annual output 200,000 tons carbide, in the Zakłady Chemiczne Oświecim (Chemical Works in Oświecim); Zakłady Gliwickie (Gliwice Works) producing activated carbon. Nadodrzańskie Zakłady Przemysłu Organicznego (Organic Compounds Works in the Odra River Region) producing phenol; Fabryka Sałterii Amonowej (Ammonium Nitrate Plant) in Kędzierzyn; and the Janikowskie Zakłady (Janikowa Works) producing soda ash. A refinery and petrochemical works are under construction in Płock. The works will process Soviet crude oil supplied to Płock by a 4,000-km pipeline under construction from Kuybyshev. The annual output of these works will amount to 5.3 million tons of fuel, lubricants,

Title : Relative Coefficient of Transmission of a Monochromator

Orig Pub: Pomiary, automat., kontrola, 1956, 2, No 7, 262-264

Abstract: When passing light, resolved by means of a monochromator of the Wadsworth type, through a second similar monochromator, the coefficient of transmission τ of the second monochromator was measured in the visible portion of the spectrum. All measurements were relative to the value of τ at $\lambda = 5600 \text{ \AA}$. Investigation was made of beams polarized both on the plane of incidence, as well as perpendicular to the plane. The general analysis of the method and the experimental conditions are given. The results of the measurements are presented in the form of a graph.

AUTHOR:

TITLE: The strength of the circular ring stiffener
reinforcing cylindrical shell

PERIODICAL: Archiwum budowy maszyn, v. 8, no. 3, 1961, 317-346

TEXT: The mutual interaction between the radial and tangential stresses of the ring stiffener and the cylindrical shell are considered in this analysis which assumes the flexural rigidity of the ring and the shell to be of a similar order of magnitude. The analysis of stresses and strains is based on the assumptions that the externally applied forces which act in the ring planes cause the ring to bend along one of its principal axes of the cross-section and the ring stiffens the infinitely long cylindrical shell halfway along its length. The theory of the bending of shells is applied throughout. The resultant externally applied loading acting at a point of the stiffener's circumference is resolved into radial and tangential components expressed by Fourier series -

The strength of the circular ...

$$p_\varphi = \sum_{m=0}^{\infty} p_{\varphi 01}(m) \cos m\varphi + \sum_{m=0}^{\infty} p_{\varphi 02}(m) \sin m\varphi, \quad (1)$$

$$p_r = \sum_{m=0}^{\infty} p_{r01}(m) \cos m\varphi + \sum_{m=0}^{\infty} p_{r02}(m) \sin m\varphi. \quad (2)$$

These equations are analyzed for various harmonics: For $m = 0$, and $m = 1$ and for $m \geq 2$. The Maxwell-Mohr system of equations is used and the amount of contribution of the ring and the shell to the strength of construction is ascertained. The coefficients of the Maxwell-Mohr's equation are also represented by formulae and this equation is analyzed in order to find the amplitude of the bending moment acting on the shell, introducing thus the coefficient of relief λ , in terms of which a simplified solution to this problem is provided. Maximum values for stresses are given for the ring and the shell. The above-described analysis is supported by the numeri-

Title : A Device for Investigating the Influence of Microorganisms
on Plant Nutrition.

Orig Pub: Acta microbiol.polon., 1956, 5, No 1-2, 109-111.

Abstract: In the Wroclaw Department of Agricultural Microbiology a device has been constructed for the sterile cultivation of plants. Under a glass cover, hermetically joined to an aluminum base, there are four small jars for cultivating plants in sand. In the cover, above the level of the jars, are four apertures to which glass tubes are connected and which are used for sowing the seed, watering the plants, and supplying them with sterile air.
